T2025_17 Why Having a Managed Network Is Important (September 23rd, 2025)

A managed network is essential for cybersecurity because it provides around-the-clock monitoring, proactive threat detection, and expert management of security controls. This helps organizations reduce vulnerabilities, ensure timely updates, and quickly respond to incidents, all of which protect sensitive data and maintain business continuity. Managed networks also give businesses access to advanced security tools and skilled professionals that may otherwise be costly to maintain in-house.
